Team 8 AI usage

Model used	Purpose of Usage	Files affected
GPT 6.1 Sol	Compare the csv results (summary.csv and transaction_metrics.csv) between a99, b99 and other optimisation experiments to generate the table comparing relevant p50 and p99 latencies to facilitate comparisons between the experiments Student supplied the csv results for comparisons, and GPT generated the relevant tables for comparisons with proposed summary and interpretation of the results, student verified the generated tables, and reviewed the suggested interpretations.	Tables used for comparison were intermediates not included in final report
GPT 6.1 Sol	Review and strengthen the provided explanations and interpretations of experiment results, and proposed improvements to structure and wording of these explanations for better clarity. GPT checked the report structure, and suggested improvements to wording and clarity of the sections. Student reviewed the report corrections	Section 3.3, 5.3
GPT 6.1 Sol	Brainstormed and compared approaches to enforce a globally serializable workload execution, including coordinator-based 2PL and optimistic concurrency-control involving compare-and-swap. Evaluated their correctness requirements and compatibility with Citus.	Section 2.3, expt_a99/, expt_b99/
GPT 6.1 Sol	Assisted with the debugging and interpretation of log results from experiment runs and correcting errors, reviewed the code and corrected compatibility with transactions. GPT reviewed logs from experiment runs to pinpoint errors and failures, and generated fixes based on highlighted errors and areas of improvement. Student verified the errors highlighted, and reviewed the corrected	expt_a99/run.sh, expt_b99/run.sh, expt_a114/run.sh, expt_b114/run.sh, expt_a204/run.sh, expt_a204/transactions/T4_product_lookup.sql

	code.	
GPT 6 Sol	Assisted with creating tables from the experiment runs and comparing specific metrics. Also assessed the raw logs for likely causes of the results and any errors. Student reviewed the conclusions and double checked the results.	Section 3.2, 5.2
Claude Opus 5.5	Converted and formatted project report in LaTex format from google docs. Reviewed and guided AI suggestions when updating the report.	Project Report
Claude Opus 5.5	Assisted with the literature review of vertical partitioning approaches, including Navathe's affinity-based algorithm, HillClimb and AutoPart. Generated scripts implementing these algorithms and translated their proposed partitions into benchmark experiments, including schema changes and corresponding transaction rewrites. AI assistance supported the explanation of the algorithms, their partitioning decisions and the associated performance tradeoffs discussed in the report.	expt_a103, expt_a113, expt_a123, expt_a205, expt_b205, expt_a206, expt_b206, expt_a207, expt_b207
